

SUPRADO

for BERMUDAGRASS MITES

“With over 20 years in the industry, I have faced many challenges in maintaining pristine greens,” says Gregory Jack. “For the past four years, as Director of Greens and Grounds, at The Oaks Club in Osprey, FL, I have managed both a paspalum and a bermudagrass course. Last year, I came across a flyer about **Quali-Pro’s Suprado** insecticide, which had received a special exemption label for bermudagrass mite control. Initially, I was skeptical it would deliver promising results.”

Jack’s team had struggled with bermudagrass mites. Often, they had to resort to multiple applications of abamectin or spirotetramat. While these solutions offered decent results, they weren’t quite hitting the mark. In their search for a more effective alternative, they decided to give Suprado a try.

“The results were astonishing!” proclaimed Jack. After just one application, Jack and his team saw a significant improvement. Unlike other treatments, Suprado provided long-lasting control; a month after application, they couldn’t find any signs of bermudagrass mites. Jack was so impressed that he immediately contacted his Quali-Pro territory manager, Jeff Rampino, to share the good news and encourage him to spread the word.

“I wholeheartedly recommend Suprado to my peers and colleagues,” said Jack. “The ease of application and the remarkable efficacy make it a standout product in the market. Given the hot and dry conditions we’ve faced in recent years, Suprado has been a game-changer for us. If you’re struggling with bermudagrass mite control, this is the solution you’ve been looking for,” Jack stated enthusiastically.
