My recommended **FUNGICIDE PROGRAM**

I highly recommend implementing a comprehensive fungicide program for your golf course to manage turf diseases effectively and maintain optimal course conditions. A proactive approach is crucial with the changing weather patterns and the increased risk of fungal outbreaks. The proposed fungicide program consists of a rotation of proven fungicides with different modes of action to reduce the likelihood of resistance development of pathogens specific to your geographic region. This approach will ensure broad-spectrum protection against common turf diseases found in the West Area, such as Microdochium Patch, Pythium Blight, Anthracnose, Dollar Spot, Yellow Patch, and Watea Patch, to name the most common.

By adhering to a regular application schedule and closely monitoring weather conditions, this program will enhance overall presentation and playability by creating an environment for the turf to thrive. The fungicide program I recommend is a reliable and cost-effective solution to safeguard the golf course's turf health and vitality. Implementing this program will undoubtedly lead to turf that is undeniably growing to its full potential.

As your trusted partner with 30 years in the turf industry and 15 years as a golf course superintendent, I am eager to assist in tailoring the program to meet your golf course's specific needs and challenges, ensuring long-term success.
